

Rotary actuator for Modbus for 2- and 3-way control ball valves

Torque 5 Nm

- Nominal voltage AC/DC 24V
- Communication via Modbus RTU (RS-485)
- Conversion of sensor signals
- LR24A-MOD with cable
- LR24A-MOD-J6 with socket

| Safety notes                 |   |
|------------------------------|---|
|                              | <ul> <li>The actuator has been designed for use in stationary heating, ventilation and air conditioning systems and is not allowed to be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.</li> <li>It may only be installed by suitably trained personnel. Any legal regulations or regulations issued by authorities must be observed during assembly.</li> <li>The switch for changing the direction of rotation may only be operated by authorized personnel. The direction of rotation must not be reversed in a frost protection circuit.</li> <li>The device may only be opened at the manufacturer's site. It does not contain any parts that can be replaced or repaired by the user.</li> <li>The cable must not be removed from the device.</li> <li>The device contains electrical and electronic components and is not allowed to be disposed of as household refuse. All locally valid regulations and requirements must be observed.</li> </ul> |
| Product features             |   |
| Principle of operation       | The actuator is fitted with an integrated interface for Modbus RTU, receives its digital positioning signal from the superordinate Modbus-Master and returns the current status.  |
| Converter for sensors        | Connection option for a sensor (passive or active sensor or switching contact). In this way, the analogue sensor signal can be easily digitised and transferred to Modbus.  |
| Parameterisable actuators    | The factory settings cover the most common applications. As desired, individual parameters can be adapted for specific systems or servicing with a service tool (e.g. ZTH-GEN). The Modbus communication parameters (address, baud rate,) are set with the ZTH-GEN. Pressing push-button 3 while connecting the supply voltage resets the communication parameters to the factory setting. Quick addressing: The Modbus address can alternatively be set using push-buttons from 1 to 16. The value selected is added to the «Basic address» parameter and results in the effective Modbus address. For example, with a basic address of 140, Modbus addresses between 141 and 156 can be parameterised using quick addressing.   |
| Simple direct mounting       | Straightforward direct mounting on the ball valve with only one screw. The assembly tool is integrated in the plug-on position indicator. The mounting position in relation to the ball valve can be selected in 90°⊲ steps.  |
| Manual override              | Manual override with push-button possible (the gear is disengaged for as long as the button is pressed or remains locked).  |
| Adjustable angle of rotation | Adjustable angle of rotation with mechanical end stops.   |
| High operational reliability | The actuator is overload-proof, requires no limit switches and automatically stops when the end stop is reached.  |
| Home position                | When the supply voltage is switched on for the first time, i.e. at commissioning or after pressing the «gear disengagement» switch, the actuator travels to the home position.<br>$\begin{array}{ c c c c c c c c c c c c c c c c c c c$  |

The actuator then moves into the position defined by Modbus-Master.

- · Registers in Bold can be written
- Registers <100 (In operation) which can be written are volatile and should therefore be updated periodically
- Registers >100 which can be written are non-volatile

### Commands

Register

All data is arranged in a table and addressed by 1..n (register) or 0..n-1 (address). No distinction is made between data types (Discrete Inputs, Coils, Input Registers, Holding Registers). As a consequence, all data can be accessed with the two commands for Holding Register. The commands for Discrete Inputs and Input Registers can be used as an alternative.

### Standard commands:

Read Holding Registers [3] Write Single Register [6]

## Note regarding Read Discrete Inputs

The command reads one or more bits and can alternatively be used for register 105 (Malfunction and service information). The start address to be used is 1664.

Optional commands: Read Discrete Inputs [2] Read Input Registers [4] Write Multiple Registers [16]

### **Electrical installation**

Modbus signal assignment:

Connection via safety isolating transformer.

Power supply and communication are not

Interconnect ground signal of the devices.

Note

Note

 $C_1 = D - = A$ 

 $C_2 = D + = B$ 

galvanically isolated.

Connection diagram for cable layout

### Connection with passive sensor, e.g. Pt1000, Ni1000, NTC

| Sensor | Temperature<br>range              | Resistance<br>range | Resolution |
|--------|-----------------------------------|---------------------|------------|
| Ni1000 | –28 +98°C                         | 850 1600 Ω          | 1 Ω        |
| PT1000 | –35 +155°C                        | 850 1600 Ω          | 1 Ω        |
| NTC    | -10 +160°C<br>(depending on type) | 200 50 kΩ           | 1Ω         |

#### Connection with switching contact, e.g. Ap-monitor

Requirements for switching contact: The switching contact must be able to accurately switch a

current of 16 mA at 24 V.

Connection with active sensor, e.g. 0 ... 10 V @ 0 ... 50  $^\circ\text{C}$ 

# LR24A-MOD(-J6)

# Rotary actuator for Modbus, AC/DC 24 V, 5 Nm, for 2- and 3-way control ball valves

Note

The actuator can be triggered with the PC tool under «PP».

### Operating controls and indicators

# 1 Direction of rotation switch

Т

Switching over: Direction of rotation changes

| 2 | 2) Push-button and LED display green |   |  |  |  |  |
|---|--------------------------------------|---|--|--|--|--|
|   | Off:                                 | No power supply or fault  |  |  |  |  |
|   | Illuminated:                         | In operation  |  |  |  |  |
|   | Flashing:                            | Address mode: pulses according to set address (1 16) when starting: |  |  |  |  |

Press button: in standard mode: switches on angle of rotation adaptation in address mode: confirmation of set address (1 ... 16)
