SIEMENS

RWF50.2 and RWF50.3

Compact universal controllers

Optimized for temperature and pressure control in connection with modulating or multistage burners and air conditioning systems

User Manual

The RWF50.2/RWF50.3 and this User Manual are intended for use by OEMs which integrate the controllers in their products!

Caution! All safety, warning and technical notes contained in the Data Sheet on the RWF50... (N7866) also apply to this document!

1.1 General notes

(j)

Please read this User Manual before switching on the controller. Keep the User Manual in a safe place which can be accessed by all users at all times.

Version!

This User Manual describes all necessary settings (applicable to controller software version XXX.01.01).

➡ Reference!

See chapter 6.7 Display of software version.

Should any problems arise during commissioning, do not make any unauthorized manipulations on the unit. You could endanger your rights under the warranty terms! Please contact us in such a case.

1.2 Typographical conventions

1.2.1 Safety notes

This User Manual contains information which must be observed to ensure your own personal safety and to prevent damage to equipment and property. The instructions and notes are highlighted by warning triangles, a hand or arrow symbol and are presented as follows, depending on the hazard level:

Qualified personnelOnly qualified personnel are allowed to install and operate the equipment.
Qualified personnel in the context of the safety-related notes contained in this
document are persons who are authorized to commission, ground and tag devices,
systems and electrical circuits in compliance with established safety practices and
standards.

Correct use Note the following:

The controller may only be used on the applications described in the technical documentation and only in connection with devices or components from other suppliers that have been approved or recommended by Siemens.

The product can only function correctly and safely if shipped, stored, set up and installed correctly, and operated and maintained as specified.

1.2.2 Warning symbols

The symbols for **Caution** and **Attention** are used in this User Manual under the following conditions:

| | Caution | This symbol is used where there may be a danger to personnel if the instructions are disregarded or not strictly observed! |
|---|-----------|---|
| ф | Attention | This symbol is used where damage to equipment or data can occur if the instructions are disregarded or not strictly observed! |
| | Attention | This symbol is used if precautionary measures must be taken when handling electrostatically sensitive components. |

1.2.3 Notification symbols

Button

chain

Command

(▲)

ConF → I nP

→ I nP1

(E**m**

| (in) | Note | This symbol is used to draw your special attention to a remark. |
|------------------|------------|---|
| ⊳ | Reference | This symbol refers to additional information in other documents, chapters or sections. |
| abc ¹ | Footnote | Footnotes are comments, referring to specific parts of the text. They consist of 2 parts: 1) Markings in the text are arranged as continuous superscript numbers 2) Footnote text is placed at the bottom of the page and starts with a number and a period |
| * | Action | An asterisk indicates that a required action is described. The individual steps are indicated by asterisks, for example: * Press |
| 1.2.4 Pr | esentation | |
| | Buttons | Buttons are shown in a circle. Either symbols or text are possible. If a button has multiple assignments, the text shown is always the text corresponding to the function currently used. |

Two buttons shown in combination with a plus sign combinations means that they must be pressed simultaneously.

> Arrows between words serve for finding parameters at the configuration level more easily or for navigating in the ACS411 setup program.

1.3 Description

| Use in heating plants | The RWF50 is used primarily for the control of temperature or pressure in oil- or gas- fired heating plants. Depending on the model, it is employed as a compact 3-position controller without feedback of angular positioning or as a modulating controller with an analog output. An external switch is provided to convert it to a 2-position controller for controlling 2-stage burners. The built-in thermostat function switches the burner on and off. |
|-----------------------|--|
| Cooling controller | The controller's operating mode can be changed from heating to cooling, or vice versa. |
| \Rightarrow | Reference! |
| | See chapter 8.2 Controller Ontr. |
| | |
| RWF50 | The controllers feature two 4-digit 7-segment displays for the actual value (red) and the setpoint (green). |
| | The RWF50.2 has a 3-position output consisting of 2 relays to open or close a |
| | controlling element. |
| | The RWF50.3 has an analog output. |
| Control | In modulating mode, the RWF50 operates as a PID controller. In 2-stage mode, the RWF50 provides control based on the set switching threshold. Using the binary input, a change to a second setpoint can be made or the setpoint can be shifted. Standard feature is a self-setting function used to determine the PID control parameters. |
| Mounting | The controller insert measures $48 \times 48 \times 104$ mm and is especially suited for installation in control panels. All electrical connections are made via screw terminals at the rear of the unit. |

1.4 Block structure

Figure 1: Block structure

2 Identification of product no.

2.1 Type field

Location:

The type field is glued onto the housing. The arrow below indicates the product no.

Example

Attention!

Mains supply must correspond to the operating voltage given on the type field.

Product nos. :

| Product no. | Description |
|-------------|--|
| RWF50.20A9 | Basic version with 3-position output – single pack |
| RWF50.21A9 | Basic version with 3-position output – multipack |
| RWF50.30A9 | Basic version with analog output – single pack |
| RWF50.31A9 | Basic version with analog output – multipack |

2.2 Scope of delivery

- Type of controller as ordered
- User Manual

Installation site and climatic conditions 3.1

- The installation site should be free from vibrations, dust and corrosive media
- The controller should be installed away from sources of electromagnetic fields, such as variable speed drives or high-voltage ignition transformers

Relative humidity: ≤95% (noncondensing) Ambient temperature: -20...50 °C Storage temperature: -40...70 °C

3.2 **Dimensions**

Figure 2: Dimensions of RWF50...

- Key
- (1) USB interface setup
- (2) Panel cutout

3.3 Side-by-side mounting

If several controllers are mounted side-by-side or above one another in a control panel, the horizontal distance between panel cutouts must be a minimum of 11 mm and the vertical distance a minimum of 50 mm.

3.4 Mounting the controller in a panel cutout

- * Remove the frame
- * Fit the seal supplied with the controller

Attention!

ad

The controller must be installed with the seal, preventing water or dirt from entering the housing!

Figure 3: Mounting in a panel cutout

- Insert the controller from the front into the panel cutout (1) and make certain the seal is correctly fitted
- ★ Fit the frame from the rear (2) and let it engage in the grooves
- ★ Tighten the screws evenly with a screwdriver (3) until the controller is correctly secured in the panel cutout

3.5 Removing the controller from the panel cutout

Attention!

ad

and a

When removing the controller, make certain that all cables are disconnected and that they do not get squeezed between control panel and housing.

3.6 Cleaning the front

The front of the controller can be cleaned with normal washing/rinsing agents or detergents.

Attention!

The front of the controller is **not** resistant to corrosive acids, caustic solutions and abrasive cleaners. Do not clean with high-pressure cleaners!

4 Electrical connections

4.1 Installation notes

Safety regulations

- The choice of cable, installation and electrical connections of the controller must conform to VDE 0100 *Regulations for the installation of power circuits with nominal voltages below AC 1000 V*, or the relevant local regulations

- The electrical connections must be made by qualified personnel
- If contact with live parts is possible while working on the unit, the controller must be disconnected from power supply (all-polar disconnection)

Connection of external components

Caution!

When connecting external components to the safety extra low-voltage inputs or outputs of the RWF50... (terminals 11, 12, 13, D1, DG, G+, G-, A+, A-, and USB port), it must be made certain that no dangerous active voltage are introduced to the RWF50...

This can be achieved by using capsulated components with double/reinforced insulation or SELV components, for example. If not observed, there is a risk of electric shock.

Screw terminals

Caution!

All screw terminals at the rear of the unit must always be properly tightened. This applies to unused terminals as well.

Fusing

Caution!

- Fusing on site must not exceed 20 A
- The fuse on the controller side (AC 250 V/1.6 A slow) conforms to IEC 60127-4
- To prevent the relay contacts from welding in the event of short-circuit in the load circuit, fusing of the output relays must give consideration to the maximum permissible relay current
 - ➡ Reference!

See chapter 12.3 Controller outputs OutP.

standards and regulations listed under Technical data

- No other loads may be connected to the controller's main power supply terminals

- The electromagnetic compatibility and interference suppression levels conform to the

Suppression of interference

Reference!
 See chapter 12.5 *Electrical data.* Input, output and supply cables should be routed separately, not parallel to one

another
All input and output lines without connection to the power supply network must be shielded and twisted. They must not be run close to live components or live cables. On the controller side.

Incorrect use

The controller is not suited for installation in areas with explosion hazard
Incorrect settings on the controller (setpoint, data of parameter and configuration levels) can affect proper functioning of the process or lead to damage.
Safety devices independent of the controller, such as overpressure relief valves or temperature limiters/monitors should therefore always be provided, and only be capable of adjustment by qualified personnel. Please observe the relevant safety regulations. Since self-setting cannot be expected to handle all possible control loops, the stability of the resulting actual value should be checked

5.1 Low-fire operation

Low-fire operation means that only small amounts of heat are drawn from the boiler. Using relay K1 *Burner release*, the 2-position controller ensures control to the setpoint by switching the burner on and off like a thermostat.

Thermostat function

Heating controller

This mode of control is known as the thermostat function. An adjustable switching differential ensures that the burner's switching frequency can be selected, aimed at reducing wear.

Modulating and 2-stage operation: Actual value lies between switch-on threshold HYS1 and switch-off threshold HYS3.

Figure 6: Control sequence of heating controller

Cooling controller

If the controller is set to cooling mode, temperature limits HYS4 and HYS6 apply. In that case, relay K1 *Burner release* is used for controlling the cooling equipment.

Figure 7: Control sequence of cooling controller

Modulating and 2-stage operation: Actual value lies between switch-on threshold **HYS4** and switch-off threshold **HYS6**.

5.2 High-fire operation

High-fire operation means that large amounts of heat are drawn from the boiler so that the burner runs continuously. If the heating load during low-fire operation rises to a level where the actual value begins to fall below switch-on threshold HYS1, the controller will not immediately switch to a higher burner output, but first makes a dynamic test of the control deviation and switches to the higher output only when an adjustable threshold (q) is exceeded (A).

 ⇒ Reference! See chapter 5.5 Response threshold (q).
 Operating mode changeover
 - In high-fire operation – depending on the application – the burner can be fired in modulating or 2-stage operation, then burning larger amounts of fuel than in low-fire operation. Binary input D1 can be used to switch between modulating and 2-stage operation

- Contacts D1 and DG open: Modulating burner operation
- Contacts **D1** and **DG** closed: 2-stage burner operation
- ➡ Reference! See chapter 8.5 Binary functions binF.

5.2.1 Modulating burner, 3-position output

Only RWF50.2

```
Area (1)
```

In area (1), the thermostat function is active. The lowest burner stage is switched on below switch-on threshold **HYS1** and switched off above switch-off threshold **HYS3**.

controller acts on an actuator via relay K2 (OPEN) and relay K3 (CLOSE). When the actual value falls below the setpoint, the response threshold (q) at point (A) is reached and the controlling element opens (greater heat output). When the actual value lies within the dead band **db**, the controlling element remains inactive. When the actual value exceeds **db**, the controlling element closes (smaller heat output).

Area (3)

If the actual value exceeds the upper switch-off threshold HYS3 in spite of the lowest heating stage, the controller switches the burner off (B). The controller only starts low-fire operation when the actual value falls below switch-on threshold HYS1 again. If the response threshold (q) is exceeded, the controller switches to high-fire operation (A).

➡ Reference! See chapter 5.5 Response threshold (q).

5.2.2 Modulating burner, analog output

Only RWF50.3

Area (1) Thermostat function active.

Area (2)

The RWF50.3 as a modulating controller provides control to the adjusted setpoint. Angular positioning is ensured via the analog output in the form of a standard signal.

be increased.

5.2.3 2-stage burner, 3-position output

In area (1), the thermostat function is active. In area (2), the RWF50.2 as a **2-position controller** acts on the second stage via relay K2 (OPEN) and relay K3 (CLOSE) by switching on at switch-on threshold **HYS1** and switching off at switch-off threshold **HYS2**.

Figure 10: Control sequence of 2-stage burner, 3-position output

In area (3), the actual value exceeds the upper switch-off threshold HYS3 and the controller shuts down the burner (**B**). The controller only starts low-fire operation when the actual value falls again below switch-on threshold HYS1. If the response threshold (q) is exceeded, the controller switches to high-fire operation (**A**).

➡ Reference!

See chapter 5.5 Response threshold (q).

5.2.4 2-stage burner, analog output

In this case, a digital standard signal switches the second stage on via the analog output (terminals **A+** and **A-**) when reaching switch-on threshold **HYS1** and off at the lower switch-off threshold **HYS2**.

Figure 11: Control sequence of 2-stage burner, analog output

Cooling controller

If the controller is set to cooling mode, the respective values of HYS4, HYS5 and HYS6 apply.

Starting from a high actual value, the controller now controls the connected cooling equipment in low-fire operation. In high-fire operation, the second stage and thus the cooling output are controlled via relays K2 and K3 or the analog output. The response threshold (q) calculates automatically (now in the reverse sense) the point from which the cooling output is to be increased.

5.3 Burner shutdown

In the event of a sensor failure at the analog input I nP1, the controller cannot monitor the actual value. Burner shutdown will automatically be triggered to guard against overheating.

Functions

- Burner off

- 3-position output for closing the controlling element
- Self-setting function is ended
- Manual control is ended

5.4 Predefined setpoint

The setpoint is predefined within the selected setpoint limits via the buttons or the ACS411 software. Using an external contact, the setpoint can also be shifted or changed over.

⇔ **Reference!** See chapter 8.5 Binary functions binF. Setpoint changeover Depending on the function selected for the binary input, the effective controller setpoint or setpoint shift can change between setpoint SP1 and setpoint SP2 or can be shifted by the amount of dSP. A contact at binary input D1 controls the changeover or shift. The values for setpoints SP1, SP2 and dSP are to be entered at the operating level. ⇔ **Reference!** See chapter 6 Operation. SP1 SP2 dSP Contact at binary input D1 Open: 0 Closed: 1 -0 **D1** -0 D1 1 2 - DG -0 **DG** 0 1 ⇒ Chapter 4.3 Assignment of pins C 1 **Function of** 02 _____ bin1 2 binary input D1 0 None (factory-set) Setpoint changeover 1 2 Setpoint shift ⇒ Chapter 8.5 Binary functions binF SPH/olhi SPL/ollo ⇒ Chapter 8.2 Controller Cntr 7866a11e/0412

Active setpoint

Figure 12: Setpoint changeover or setpoint shift

Entry

5.5 Response threshold (q)

The response threshold (q) defines for what period of time and how much the actual value is allowed to drop before the system switches to high-fire operation. An internal mathematical calculation using an integration function determines the sum of all areas qeff = q1 + q2 + q3 as shown in the graph. This takes place only when the control deviation (x-w) falls below the value of switch-on threshold HYS1. If the actual value increases, integration is stopped.

If *qeff* exceeds the preset response threshold (q) (can be adjusted at the parameter level), this causes the second burner stage to switch on or – in the case of the 3-position controller/modulating controller – the controlling element to open. If the current boiler temperature reaches the required setpoint, *qeff* is reset to 0.

Figure 13: Control sequence response threshold (q)

In contrast to time-dependent switching on, load-dependent switching on offers the advantage of capturing the dynamics of the actual value.

Also, monitoring the progression of the actual value during the change from low-fire to high-fire ensures low switching frequencies to reduce wear and to extend running times.

Cooling controller The response threshold (q) also works (in the reverse sense) in the case of cooling mode.

5.6 Cold start of plant

| Interlocking | | Note! Functions <i>Cold start of plant</i> and <i>Thermal shock protection (TSS)</i> are interlocked. Only one function can be activated, but never both at the same time. |
|--------------------|--|--|
| Heating controller | | When a heating system is switched off for a longer period of time, the actual value will drop of course. To achieve a faster control response, the controller immediately starts in high-fire operation as soon as the control deviation (x-w) drops below a certain limit value. |
| | | This limit is calculated as follows: |
| | | Limit value = 2 x (HYS1-HYS3) |
| | | In that case, the response threshold (q) is inactive, independent of operating mode and controlled variable (temperature or pressure). |
| Example | | Operating mode: Modulating, 3-position output HYS1 = -5 K HYS3 = +5 K w = 60 °C |
| | | Limit value = 2 x (-5-5) = 2 x (-10) = -20 K |
| | | At an actual value below 40 °C, heating up immediately starts in low-fire operation, and |

not in thermostat mode.

Figure 14: Control sequence Cold start of plant

| Cooling controller | Cold start of plant also works when the RWF50 is used as a cooling controller. | |
|--------------------|--|--|
| | In that case, the limit value is calculated as follows: Limit value = 2 x (HYS4-HYS6) | |
| Example | Operating mode: Modulating 3-position output HYS4 = 5 K HYS6 = -5 K w = -30 °C Limit value = 2 x (5 +5) = 2 x (10) = +20 K | |

When the actual value lies above -10 $^\circ C,$ cooling is immediately started in high-fire mode in place of low-fire mode.

5.7 Thermal shock protection (TSS)

Interlocking

Note!

Functions *Cold start of plant* and *Thermal shock protection (TSS)* are interlocked. Only one function can be activated, but never both at the same time.

The controller comes with thermal shock protection (TSS) deactivated; it can be activated at the configuration level.

⇒ Reference!

See chapter 8.3 Thermal shock protection (TSS) rAFC.

Function

The function is automatically activated when the actual value drops below the adjustable limit value rAL (exceeds the adjustable limit value with the cooling controller). In that case, the setpoint is approached via a ramp function.

Gradient and slope of the ramp rASL are adjustable. The setpoint ramp has a symmetrical tolerance band toLP. If, during the startup phase, the actual value leaves the tolerance band, the setpoint ramp is stopped until the actual value returns to a level within the tolerance band. The startup phase is ended when the setpoint of the ramp function reaches the final setpoint SP1.

Note!

When thermal shock protection (TSS) is active, the controller operates in low-fire operation. The response threshold (q) is active.

6.1 Meaning of display and buttons

6.2 Basic display

When switching power on, the displays show hyphens for about 5 seconds.

Figure 17: Display start

The state that follows is called *normal display*. Default display is the actual value and the current setpoint. Other values can be displayed at the configuration level or via PC software ACS411.

➡ Reference! See chapter 8.6 Display di SP.

Manual control, self-setting, the user, parameter and configuration levels can be activated from here.

Figure 18: Basic display

6.3 User level

This level is started from the basic display. Setpoints SP1, SP2 or dSP can be altered.

Changing the setpoints

- * From the basic display, press 🖻 so that 0Pr appears
- * Press 🕑 so that SP1 appears
- * Press 🕑 and SP1 flashes
- * Press () or () to adjust the required setpoint and press () to confirm

Timeout

Timeout after about 180 seconds.

(F

Note! If the setpoint is not stored, the basic display changes after the timeout tout and the former setpoint is maintained.

The value changes only within the permitted range.

6.4 Manual control, modulating burner

| (F | | Note! Manual control can only be activated if the thermostat function energized relay K1. If the thermostat function deenergized relay K1 during manual control, manual control is ended. | |
|----------------------------------|---|--|--|
| | * | Press for 5 seconds | |
| | | HAnd appears on the lower display, alternating with the value for manual control. | |
| RWF50.2 3-position controller | * | Open and close fuel-air ratio control by pressing 🕥 and 💽 | |
| | | Relay K2 opens the controlling element as long as \bigcirc is kept depressed. Relay K3 closes the controlling element as long as \bigcirc is kept depressed. | |
| | | The 2 yellow arrows indicate when relay K2 opens or relay K3 closes the controlling element. | |
| RWF50.3 Modulating controller | * | Change angular positioning by pressing 🛆 or 文 | |
| | * | Adopt flashing new angular positioning by pressing 🐑 | |
| | | Per default, the analog output delivers the current angular positioning. | |
| | * | Return to automatic operation by keeping 座 depressed for 5 seconds | |
| | | | |

Note!

When activating manual control, angular positioning is set to 0 until another entry is made.

6.5 Manual control, 2-stage burner

- * Press 座 for 5 seconds
- * Press A briefly

| RWF50.2 | RWF50.3 | | | |
|--|--|--|--|--|
| Relay K2 is active Relay K3 is inactive | The analog output delivers the highest value (depending on setting DC 10 V or 20 mA) | | | |
| Controlling element opens | | | | |

* Or press 💽 briefly

| RWF50.2 | RWF50.3 | | | |
|--|--|--|--|--|
| Relay K2 is inactive Relay K3 is active | The analog output delivers the lowest value (depending on setting DC 0 V, 4 mA, or 0 mA) | | | |
| Controlling element closes | | | | |

* Return to automatic operation by pressing 🕑 for 5 seconds

Note!

If the thermostat function **deenergizes** relay K1 during manual control, manual control is ended.

6.6 Starting the self-setting function

Start

* Press (+) for 5 seconds

Cancel

* Cancel with (+)

Figure 19: Display of self-setting function

When **tUnE** stops flashing, the self-setting function has been ended.

The parameters calculated by the controller are automatically adopted!

Note! It is not possible to start **tUnE** in manual control or low-fire operation.

6.7 Display of software version

* Press 🕒 + 🔺

Figure 20: Display of software version

Segment test

Figure 21: Display segment test

All display segments and LEDs light up; the actual value display (red) flashes for about 10 seconds.

7 Parameterization PArA

Here, set the parameters associated directly with the controller's adaptation to the controlled system after the plant has been put into operation.

Note!

The display of the individual parameters depends on the type of controller.

Figure 22: Parameterization

Access to this level can be locked.

```
    Reference!
    See chapter 8.6 Display di SP.
```

- * From the basic display, press 🕑 so that 0Pr appears
- * Press 🕞 so that PArA appears
- * Press is so that the first parameter of the parameter level is displayed

Display of controller parameters

The parameters are shown on the lower setpoint display (green) and their values on the upper/actual value display (red).

| Parameter | Display | Value range | Factory setting Remarks | | | |
|---|---------|-----------------------|----------------------------|---|--|--|
| Proportional band ¹ | Pb1 | 19999 digit | 10 | Influences the controller's P-action | | |
| Derivative time | 46 | 09999 s | 80 | Influences the controller's D-action | | |
| | dt | 0 | 00 | With dt = 0, the controller has no D-action | | |
| Integral action time | rt | 09999 s | 350 | Influences the controller's I-action | | |
| | | | | With rt = 0, the controller has no I-action | | |
| Dead band (neutral zone) ¹ | db | 0.0999.9 digit | 1 | For 3-position output | | |
| Controlling element running time | tt | 103000 s | 15 | Running time of the positioning valve for use with modulating controllers | | |
| Switch-on threshold Heating controller ¹ | HYS1 | -19990.0 digit | -5 | Reference! See chapter 5.2 <i>High-fire operation</i> | | |
| Switch-off threshold stage II Heating controller ¹ | HYS2 | 0.0HYS3 digit | 3 | Reference! See chapter 5.2 High-fire operation | | |
| Switch-off threshold Heating controller ¹ | HYS3 | 0.09999 digit | 5 | Reference! See chapter 5.2 High-fire operation | | |
| Switch-on threshold Cooling controller ¹ | HYS4 | 0.09999 digit | 5 | Reference! See chapter 5.2 High-fire operation | | |
| Switch-off threshold stage II Cooling controller ¹ | HYS5 | HYS6 0.0 digit | -3 | Reference! See chapter 5.2 High-fire operation | | |
| Switch-off threshold Cooling controller ¹ | HYS6 | -19990.0 digit | -5 | Reference! See chapter 5.2 High-fire operation | | |
| Response threshold | | 0.0999.9 | 0 | Reference! See chapter 5.5 <i>Response threshold</i> (q) | | |

¹ Setting of decimal place has an impact on this parameter

Note!

When using the RWF50... as a modulating controller only, or as a modulating controller without the burner release function (1P, 1N), parameter HYS1 must be set to 0 and parameters HYS2 and HYS3 must be set to their **maximum** values.

Otherwise, for example, when using default parameter HYS1 (factory setting -5), the 3-position controller is only released when the control deviation reaches -5 K.

8 Configuration ConF

Here, the settings (e.g. acquisition of measured value or type of controller) required directly for commissioning a certain plant are made and, for this reason, there is no need to change them frequently.

Figure 23: Configuration

Access to this level can be locked.

Reference!

See chapter 8.6 Display di SP.

Note!

The following tables show the default settings in columns *Value/selection* and *Description* in **bold** printing.

8.1 Analog input I nP1

An analog input is available.

| | | | | | |
| | | | Cooling controller: | | |
| | | | If the actual value lies above this limit value, the setpoint is approached in | | |
| | | | the form | of a ramp until final setpoint SP1 is reached. | |

8.4 Control outputs OutP

With the RWF50.2, configuration of the outputs relates to the binary outputs (K2 and K3), and with the RWF50.3, to the analog outputs (A+ and A-). The burner is released via relay K1.

The switching states of relay K1 *Burner release* (LED green), relay K2 *Controlling element OPEN,* and relay K3 *Controlling element CLOSE* (yellow LED arrows) are indicated on the controller front.

Only RWV50.2...Binary outputsThe binary outputs of the RWF50.2 offer no setting choices.

Only RWF50.3... Analog output The RWF50.3 has an analog output.

The analog output offers the following setting choices:

$ConF \rightarrow OutP \rightarrow$

| Parameter | Value/ selection | Description |
|--|----------------------------|--|
| Function FnCt Function | 1 4 | Analog input I nP1 is delivered Controller's angular positioning is delivered (modulating controller) |
| Signal type Si Gn Type of signal | 0 1 2 | 020 mA 420 mA DC 010 V Physical output signal |
| Value when out of range r0ut Value when out of range | 0 101 | Signal (in percent) when measuring range is crossed 101 = last output signal |
| Zero point OPnt Zero point | -1999 0 +9999 | A value range of the output variable is assigned to a physical output signal |
| End value | -1999 100 | |
| End value | +9999 | |

8.5 Binary input binF

This setting decides on the use of the binary input.

➡ Reference!

See chapter 5.4 Predefined setpoint.

ConF → bi nF →

| Parameter | Value/ | Description |
|---------------|-----------|------------------------------|
| | selection | |
| Binary input | 0 | No function |
| bin1 | 1 | Setpoint changeover |
| Binary inputs | 2 | Setpoint shift |
| | 4 | Changeover of operating mode |
| | | Burner modulating: |
| | | Contacts D1 and DG open |
| | | Burner 2-stage: |
| | | Contacts D1 and DG closed |

8.6 Display di SP

By configuring the position of the decimal point and automatic changeover (timer), both LED indications can be adapted to the respective requirements. Timeout tout for operation and the locking of levels can be configured as well.

$ConF \rightarrow dI SP \rightarrow$

| Parameter | Value/ selection | Description | |
|-------------------|---------------------|---|--|
| Upper display | | Display value for upper display | |
| di SU | | | |
| Upper display | 0 | Switched off | |
| | 1 | Analog input I nP1 | |

| Decimal point | 2 | Two decimal places | |
| | | If the value to be displayed cannot be shown with the programmed decimal | |
| | | point, the number of decimal places is automatically reduced. If the | |
| | | measured value drops again, the number of decimal places is increased | |
| | | until the programmed value is reached | |
| Locking of levels | 0 | No locking | |
| CodE | 1 | Locking of configuration level | |
| | 2 | Locking of parameter level | |
| | 3 | Locking of keyboard | |

9.1 Self-setting function in high-fire operation

Note!

tUnE is only possible in high-fire operation, in modulating burner mode.

Self-setting function **tUnE** is a proper software function unit integrated in the controller. In *modulating* mode, **tUnE** tests in high-fire operation the response of the controlled system to angular positioning steps according to a special procedure. A complex control algorithm uses the response of the controlled system (actual value) to calculate and automatically store the control parameters for a PID or PI controller (set dt = 0!). The **tUnE** procedure can be repeated any number of times.

Figure 24: Self-setting function in high-fire operation

2 procedures

The **tUnE** function uses 2 different methods that are automatically selected depending on the dynamic state of the actual value and the deviation from the setpoint at startup. **tUnE** can be started from within any dynamic actual value sequence.

If there is a **great difference between actual value and setpoint** when **tUnE** is activated, a switching line is established about which the controlled variable performs forced oscillations during the self-setting process. The switching line is set to such a level that the actual value should not exceed the setpoint.

Figure 25: Great difference between actual value and setpoint

With a **small deviation** between setpoint and actual value (after the controlled system has settled, for instance), forced oscillation about the setpoint is performed.

Figure 26: Small control deviation

The data of the controlled system recorded for the forced oscillations are used to calculate the controller parameters **rt**, **dt**, **Pb1** and a filter time constant dF1 for actual value filtering that is optimized for this controlled system.

Conditions

- High-fire operation in modulating burner mode

- The thermostat function (relay K1) must be constantly activated; otherwise **tUnE** will be canceled and no optimized controller parameters will be adopted
- The above mentioned actual value oscillations during the self-setting process must not exceed the upper threshold of the thermostat function (increase if necessary, and lower the setpoint)

Note!

A successfully started *Self-setting* function is automatically aborted after 2 hours. This could occur in the case of a controlled system that responds slowly, for example, where, even after 2 hours, the described procedures cannot be successfully completed.

9.2 Checking the controller parameters

Optimum adjustment of the controller to the controlled system can be checked by recording a startup sequence with the control loop closed. The following diagrams indicate possible incorrect adjustments, and their correction.

Example

The response to a setpoint change is shown here for a 3rd order controlled system for a PID controller. The method used for adjusting the controller parameters can, however, also be applied to other controlled systems. A suitable value for **dt** is **rt/4**.

7865d18/1099 Figure 31: Optimum adjustment

50/68

User Manual RWF50... 9 Self-setting function

- t

t

t

PC software ACS411 is an operating module for use with the RWF50... universal controller and designed for the following basic tasks:

- Visualization of system state covering the following data:
 - Parameters
 - Process data
 - Configuration and parameterization of the controller (individual parameters)
 - Saving and restoration of parameter sets

A USB cable can be used to establish the connection between PC (USB plug type A, 4 pins) and RWF50... (USB plug type Mini B, 5 pins).

Note!

The cable must be purchased on site.

10.1 Safety notes

Caution!

PC software ACS411 is a convenient tool for use by qualified personnel, designed to commission and optimize the universal controller. Since the required actions and settings are safety-related, the user has a special obligation to exercise due care. Although specific technical measures have been taken to prevent incorrect entry of data and wrong parameter values, the user must check the correct function of the plant in a conventional way both during and after commissioning and – if required – ensure manual shutdown.

10.2 Setting the correct system parameters

Caution!

It should be noted that the characteristics of the universal controller are determined primarily by the parameter settings made, rather than by the type of unit. It is especially the OEM which is responsible for making certain that the controller's parameter settings are in compliance with the standards covering the respective application or type of plant. Responsibility for the parameter settings is assumed by the person who, in accordance with the access rights, makes or has made changes at the respective setting level. The detailed descriptions and safety notes given in the User Manual on the system components must also be observed.

10.3 Changing the parameters

Caution!

After changing parameters, all parameters must be checked via the unit's display to ensure they are correctly set – without making use of the PC software ACS411.

10.4 Place of installation

イア

Caution!

PC software ACS411 is designed for use on site, that is, within viewing and hearing distance of the respective combustion plant. This means that remote control is not permitted.

10.5 License and liability regulations

Note!

For ENDUSER LICENSE AGREEMENT for PC software ACS411, refer to program menu item *Info* → *Software documentation*. IMPORTANT – PLEASE READ CAREFULLY!

10.6 Procurement of PC software ACS411

For ordering the ACS411 software and updates, please contact your supplier or heating engineer.

10.7 Languages

PC software ACS411 is available in English and German. To select the language you require, go to program menu item *File* \rightarrow *Default settings* \rightarrow *Program language* (ACS411 setup program must be restarted).

10.8 Operating systems : Operating

- Windows 2000 SP4
- Windows 7 32 bit
- Windows 7 64 bit
- Windows VISTA
- Windows XP

10.9 Prerequisites for hardware

- Free hard disk memory: 300 MB
- RAM: 512 MB

10.10 Installation

Note!

First, install PC software ACS411; then, connect the controller. If not observed, an error message is delivered.

PC software ACS411 is supplied on a CD.

- ★ Insert CD in the CD or DVD drive. Setup starts automatically.
- * Follow the instructions appearing on the screen.
- ★ Connect PC and controller via the USB cable.
 New hardware is identified and USB driver installed.
 This may take a few minutes.
- ★ Follow further instructions given on the screen and wait until the installation is successfully completed.

10.11 Others

10.11.1 Use of USB port : Use of

Use The USB port is intended for temporary use to make the parameter settings, the configuration and for work in connection with commissioning. When using the USB port, the controller can be securely operated, tested and set with no need for using the mains cable.

10.11.2 Powering the controller via the USB port : Powering the controller

via the port

reduce power consumption.

Using the HUB: Using
theIf the controller shall be powered via the USB port, a HUB with power supply is
required, capable of delivering at least 500 mA at every outlet.

Switching off: Switching off

(B

Note!

Check to ensure that power supply to the measuring converter (G+ and G-) is not connected. This increases power usage via the USB port as well.

When supplying power via the USB port, relays and analog output are deenergized to

Measuring accuracy:

The measuring accuracy specified in chapter 12 *Technical data* does not apply when powering the controller via the USB port.

11.1 Alarm messages:

| Display | Cause | Rer | nedy |
|--|---|--------|---|
| 9999 flashing | Measured value exceeded limit The measured value is too great, lies outside the measuring range, or the sensor is faulty | * | Check to see if sensor and connecting line are damaged or have a short-circuit |
| ESC () () () () () () () () () () () () () | Measured value dropped below limit The measured value is too small, lies outside the measuring range, or the sensor has a short-circuit | ⇒ * | Reference! See chapter 4.3 <i>Assignment of pins</i> Check to see if the correct sensor is selected or connected |
| | | ⇔ | Reference! See chapter 8.1 Analog input I nP1 |

12.1 Inputs

12.1.1 Resistance thermometers

| Туре | Measuring range | Measuring accuracy ^a | Impact of ambient temperature |
|----------------------|-----------------------------|------------------------------------|-------------------------------------|
| Pt100; DIN EN 60751 | -200850 °C (-3281562 °F) | ≤0.1% | 50 ppm/K |
| Pt1000; DIN EN 60751 | -200850 °C (-3281562 °F) | ≤0.1% | 50 ppm/K |
| LG-Ni1000 | -50+160 °C (-58320 °F) | ≤0.1% | 50 ppm/K |
| 0135 Ω | | ≤0.25% | 50 ppm/K |

^a Accuracies relate to the maximum measuring range.

| Line resistance | Max. 30 Ω per line with 3-wire circuit | |
|-----------------|---|--|
| Line balancing | Not required with 3-wire circuits. | |
| | With 2-wire circuits, line balancing can be | |
| | performed by making an actual value | |
| | correction | |

12.1.2 Input signals

| Measuring range | Measuring | Impact of ambient |
|-----------------------------------|-----------------------|-------------------|
| | accuracy ^a | temperature |
| Voltage DC 010 V | ≤0.1% | 100 ppm/K |
| Input resistance RE >2 M Ω | | |
| Voltage DC 0(1)5 V | ≤0.2% | 200 ppm/K |
| Input resistance RE >2 M Ω | | |
| Current 0(4)20 mA | ≤0.1% | 100 ppm/K |
| Voltage drop ≤2 V | | |

^a Accuracies relate to the maximum measuring range.

12.1.3 Binary input D1

Potentialfree contact for the following functions, depending on the configuration:

- No function
- Setpoint readjustment
- Setpoint changeover
- Operating mode changeover

12.2 Monitoring the measuring circuit

In the event of error, the outputs assume defined states (configurable).

| Measuring transducer | Measured value crossed limit | Sensor/line has short-circuit | Sensor/line interrupted |
|-------------------------|---------------------------------|-------------------------------|----------------------------|
| Resistance | • | • | • |
| thermometer | | | |
| Voltage 15 V | • | • | • |
| 05 V, 010 V | (•) | | |
| Current 420 mA | • | • | • |
| 020 mA | (●) | | |

e = detected

(●) = detected only if measuring range is exceeded

- = not detected

12.3 Controller outputs OutP Controller o

| Relay K1 (NO) 1P, 1N (burner release) | |
