## Safety notes

- The actuator has been designed for use in stationary heating, ventilation and air conditioning systems and is not allowed to be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.
- It may only be installed by suitably trained personnel.

All applicable legal or institutional installation regulations must be complied with.

- The device may only be opened at the manufacturer's site. It does not contain any parts that can be replaced or repaired by the user.
- The device contains electrical and electronic components and is not allowed to be disposed of as household refuse. All locally valid regulations and requirements must be observed.
- The switch for changing the direction of rotation may only be operated by trained personnel. The direction of rotation may not be reversed in a frost protection circuit.

Mode of operation The actuator is controlled by means of a standard control signal DC $0 \ldots 10 \mathrm{~V}$. It opens to the position dictated by this signal.

Simple direct mounting Straightforward direct mounting on the ball valve with only one screw. The mounting position in relation to the ball valve can be selected in $90^{\circ} \triangleleft$ steps.

Manual operation Manual operation possible by lever (the gearing latch remains disengaged as long as the selfresetting lever is pressed).

High functional reliability
Combination valve actuators

The actuator is overload-proof and automatically stops when the end stop is reached.
Refer to the valve documentation for suitable valves, their permitted media temperatures and closing pressures.
